

# **The Ghana Cocoa Report 2024: Cocoa Farming Land Use in Ghana: Challenges and Sustainable Solutions**

Explore how land is used for cocoa farming in Ghana, the environmental and economic challenges it presents,

## **Highlights**

Examination of how land is utilized for cocoa farming in Ghana and its impact on the environment and economy.

Insights into key statistics related to land use patterns, deforestation, and productivity in cocoa-growing regions.

Strategic recommendations for sustainable land management to ensure long-term productivity and environmental protection.

## **Content**

**Cocoa Farming Land Use in Ghana: Balancing Productivity and Sustainability**

## Highlights:

Examination of how land is utilized for cocoa farming in Ghana and its impact on the environment and economy.

Insights into key statistics related to land use patterns, deforestation, and productivity in cocoa-growing regions.

Strategic recommendations for sustainable land management to ensure long-term productivity and environmental protection.

## Research Methodology:

This analysis is based on a combination of data from the Ghana Cocoa Board (COCOBOD), the Ministry of Food and Agriculture, and international organizations such as the International Cocoa Organization (ICCO) and the Food and Agriculture Organization (FAO). The research integrates quantitative land use statistics with qualitative assessments of farming practices, sustainability initiatives, and economic implications.

## Key Statistics and Facts:

1. Cocoa cultivation covers approximately 1.6 million hectares of land in Ghana, accounting for about 25% of the country's agricultural land use.
2. Over 800,000 smallholder farmers are involved in cocoa production, with most farms being less than 5 hectares in size.
3. Approximately 33% of Ghana's forest cover in cocoa-growing regions has been lost due to the expansion of cocoa farms.
4. The average yield per hectare in Ghana is 400-600 kilograms, with modern farming techniques offering the potential to increase this to over 1,000 kilograms per hectare.
5. Agroforestry, which integrates shade trees with cocoa cultivation, is practiced on about 30% of cocoa farms, promoting biodiversity and soil health.
6. The deforestation rate in cocoa-growing regions is approximately 2% annually, largely driven by cocoa expansion.
7. Ghana's government, through COCOBOD, aims to rehabilitate 100,000 hectares of aging cocoa farms by 2025 through its Productivity Enhancement Program (PEP).
8. Only about 35% of cocoa farms currently employ climate-smart agriculture techniques, though the government is working to increase adoption.
9. Ghana aims to increase its cocoa production to 1.5 million tonnes annually by 2026 while simultaneously reducing deforestation by 40%.
10. Deforestation linked to cocoa expansion in Ghana contributes to 27% of emissions in the country's agricultural sector.

## Body of Article / Critical Analysis:

### Introduction

Cocoa farming in Ghana is a critical economic activity that supports over 800,000 smallholder farmers and contributes significantly to the country's GDP and foreign exchange earnings. However, the increasing demand for cocoa, both locally and internationally, has led to extensive land use changes, particularly deforestation in cocoa-growing regions. This article explores the current patterns of land use in cocoa farming, the environmental and economic challenges posed by these changes, and strategies to balance cocoa production with sustainable land management.

### Land Use in Cocoa Farming: Overview and Challenges

Cocoa farming in Ghana is predominantly a smallholder activity, with most farmers cultivating less than 5 hectares of land. The total land area under cocoa cultivation is approximately 1.6 million hectares, representing about a quarter of the country's total agricultural land. Cocoa farms are concentrated in Ghana's High Forest Zone, including the Ashanti, Western, Eastern, and Central regions, where the climate and soil conditions are ideal for cocoa production.

1.

#### Deforestation and Land Degradation

The expansion of cocoa farming has been a major driver of deforestation in Ghana. Forests are often cleared to make way for new cocoa farms, contributing to the loss of biodiversity and increased carbon emissions. The deforestation rate in cocoa-growing regions is estimated to be around 2% per year. This has resulted in the loss of about 33% of forest cover in cocoa-producing areas over the past few decades. While cocoa farming is crucial for the livelihoods of many Ghanaians, its environmental impact raises concerns about long-term sustainability.

2.

#### Productivity and Land Use Efficiency

The average yield of cocoa per hectare in Ghana ranges from 400 to 600 kilograms, significantly lower than the potential yields achievable through modern farming techniques. This low productivity drives farmers to expand their cocoa farms into forested areas in search of fertile land, exacerbating deforestation. However, COCOBOD's Productivity Enhancement Program (PEP) seeks to address this by providing farmers with access to high-yielding, disease-resistant cocoa seedlings, fertilizers, and training. The goal is to increase yields to over 1,000 kilograms per hectare, reducing the need for further land expansion.

3.

#### Agroforestry and Sustainable Land Use

Agroforestry, which integrates cocoa farming with the preservation of shade trees, is a promising solution to the environmental challenges posed by cocoa expansion. Shade-grown cocoa improves soil health, reduces the need for chemical inputs, and enhances biodiversity. Currently, about 30% of cocoa farms in Ghana practice agroforestry, though this figure is expected to rise as more farmers adopt sustainable farming practices. Agroforestry is particularly important in mitigating the effects of climate change, as it helps maintain soil moisture and protect cocoa trees from extreme weather conditions.

### Current Land Use Challenges in Cocoa Farming

1.

## **Land Tenure Issues**

Unclear land tenure systems in Ghana complicate efforts to manage land use sustainably. Many cocoa farmers do not have formal ownership of the land they farm, which discourages long-term investments in sustainable practices. Reforms to clarify land ownership and rights are needed to encourage farmers to invest in practices that enhance soil fertility and prevent land degradation.

2.

## **Climate Change Impact**

Climate change poses a significant threat to cocoa farming in Ghana. Changing rainfall patterns, higher temperatures, and prolonged dry seasons are affecting cocoa yields, especially in regions that rely on rain-fed agriculture. Climate-smart agriculture, which includes techniques such as irrigation and mulching, can help mitigate the impacts of climate change, but adoption rates remain low.

3.

## **Aging Farms and Low Productivity**

Many of Ghana's cocoa farms are over 30 years old, resulting in declining yields and soil fertility. COCOBOD's replanting programs aim to rehabilitate aging farms by introducing high-yielding and disease-resistant cocoa varieties. However, the scale of the problem requires sustained investment and widespread adoption of modern farming practices.

## Current Top 10 Factors Impacting Cocoa Farming Land Use in Ghana:

1. **Deforestation:** The expansion of cocoa farms into forested areas has been a primary driver of deforestation in Ghana's cocoa-growing regions.
2. **Climate Change:** Erratic weather patterns and rising temperatures are affecting the suitability of land for cocoa farming.
3. **Agroforestry Adoption:** Agroforestry practices are helping to balance cocoa production with environmental conservation, though adoption remains limited.
4. **Low Productivity:** Low yields push farmers to expand their farms into new areas, often leading to deforestation.
5. **Land Tenure Issues:** Unclear land ownership and tenure rights discourage long-term investments in sustainable land use.
6. **Pests and Diseases:** The spread of diseases like the swollen shoot virus further degrades land and reduces productivity.
7. **Government Policies:** COCOBOD's policies on farm rehabilitation and input distribution play a significant role in determining how land is used for cocoa farming.
8. **International Certification Standards:** Sustainability certifications like Fairtrade and Rainforest Alliance influence land use decisions by promoting environmentally friendly practices.
9. **Market Demand:** Increasing global demand for cocoa encourages the expansion of cocoa farms, often at the expense of forests.
10. **Access to Inputs:** The availability of fertilizers, seedlings, and pesticides impacts how efficiently land is used and how much new land is cleared for farming.

## Projections and Recommendations:

Ghana's cocoa industry is projected to grow, with plans to increase production to 1.5 million tonnes annually by 2026. However, this growth must be balanced with sustainable land management practices to prevent further deforestation and environmental degradation.

### Recommendations:

1. **Promote Agroforestry:** Expanding agroforestry practices across more cocoa farms will help mitigate the environmental impact of cocoa farming and enhance biodiversity.
2. **Enhance Land Tenure Reforms:** Clearer land ownership laws will incentivize farmers to invest in sustainable land management practices, improving long-term productivity and preventing land degradation.
3. **Invest in Climate-Smart Agriculture:** Increasing farmer access to climate-smart agricultural techniques, such as irrigation and soil conservation, will help protect cocoa yields from the effects of climate change.
4. **Expand Replanting Programs:** COCOBOD should intensify its replanting programs to rehabilitate aging farms with high-yield, disease-resistant varieties, reducing the need for land expansion.

## Conclusion:

Cocoa farming in Ghana is both an economic lifeline and a driver of environmental change. The expansion of cocoa farms has contributed to deforestation and land degradation, posing significant challenges to sustainability. However, with the right policies and investments, Ghana can balance increased cocoa production with responsible land use practices. By promoting agroforestry, implementing land tenure reforms, and expanding climate-smart agriculture, Ghana can ensure the long-term viability of its cocoa sector while protecting the environment.

## Notes:

This article integrates data from COCOBOD, ICCO, and other agricultural research to provide a comprehensive analysis of cocoa farming land use in Ghana.

Projections and recommendations are based on current trends in land management, sustainability, and productivity initiatives.
